1. Machine introduction

This machine is a single needle, long working space, and feed with needle bar. It has a working pressure pipe and the main motor is driven by a timing belt and a frequency converter. Total power is 3.7kW.

The machine has a large working space and can be used in a small workshop. It is suitable for small batch production.

Sample for processing: fabric, papers, rubber products, leather, plastic, etc.

2. Main specifications

Model	DS-2000	Working Pressure (PSI)	100-400
Applications	Clothing, leather, cloth materials		
Max. Sewing speed	10000 spm	10000 spm	
Max. Motor Power	3.7kW		
Needle Number	1		
Distance to work	100mm		
Needle	DY #3.768-100		
Working space	762mm (W) x 1000mm (D) x 1520mm (H)		
Bed size	1100mm		
Motor power	3.7kW		
Normal voltage	110V - 120V - 220V - 240V		
	AC 50/60Hz		

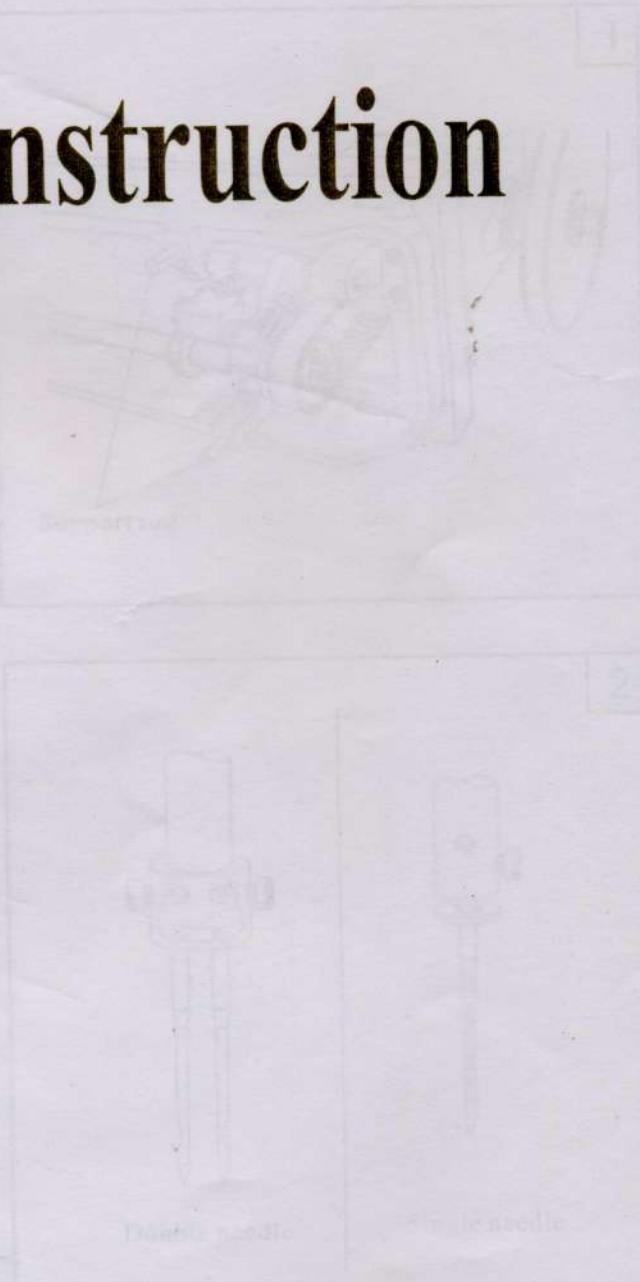

3. Installation and operation preparation (Fig. 1)

Operation Instruction

1. The top diagram of the base wheel must face to the right.
2. The top diagram of the base wheel must face to the left.
3. Please allow a run at the max. speed for a new machine, when up to the max. speed is acceptable.
4. If you want to change one on the table, please first turn off the power supply.

4. Needles (Fig. 2)

- Please take care of the following points when changing needles:
1. When changing needles (or the hand wheel) in. If the needle is not aligned in its original position, just set the needle to the original position, the needle should be in the same direction as the original (single needle) or double (two needles) or three needles (three needles).
 2. When changing needles (or the hand wheel), if the needle is too tight, it will damage the needle plate, so when changing needles, do not tighten the needle plate, then tighten the needle plate.

1.Brief introduction

This series machines adopt sliding type take-up lever mechanism, compound feed with needle feed, bottom feed and alternating presser feet and link type feeding mechanism. Driven by timing belt and extra large hook is installed to form seam #301.

These machines have the large working space and high lifting height of presser foot so it's suitable for sewing large products.

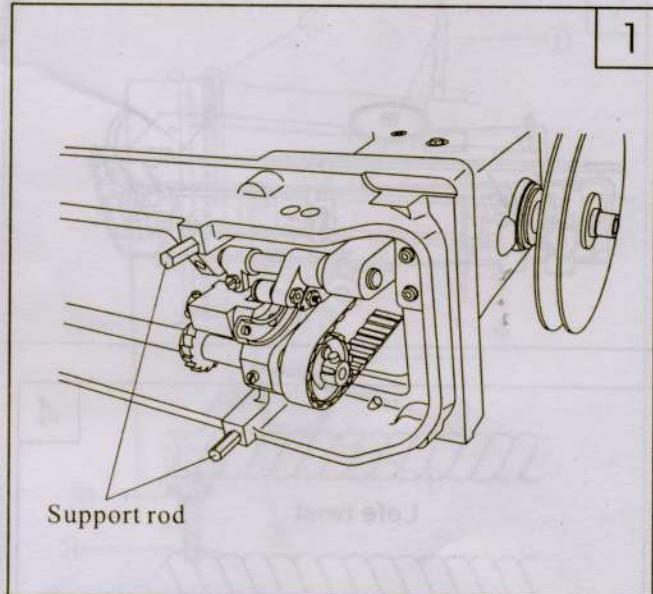

Suitable for stitching tents, canvas, rubber products, heavy leather and furniture

2.Main specifications

Model	TWI-28BL30	TWI-8BL30	TWI-28BL20	TWI-8BL20
Applications	Extra heavy weight materials			
Max Sewing Speed	800s.p.m		1000s.p.m	
Max Stitch length		10mm		
Needle Number	2	1	2	1
Presser foot lift height		20mm		
Needle	DY×3 24#~26#(standard26#)			
Working space	762mm×153mm	508mm×153mm		
Bed size	1100mm×230mm	846mm×230mm		
Motor power	550W, 4P			
Needle gauge	1/4"、1/2"、3/4"、1"、1 1/4"、1 1/2"、 1 1/4"、2"、7/8" Standard1/4" (for 2 needle machine)			

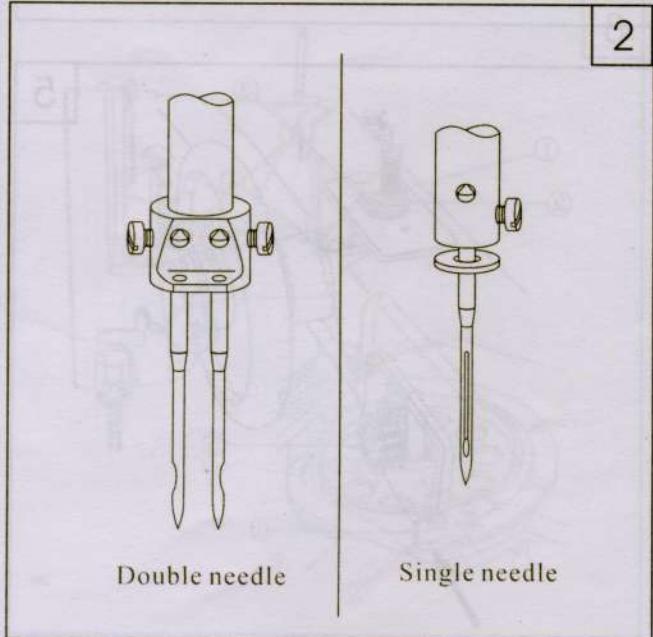

3.Installation and operation preparation(Fig.1)

- 1.Before test and operation, the places need to lubricated must be oiled, during the testing time, the lubrication should be more frequently.
- 2.The turn direction of the hand wheel must face to the operator.
- 3.Please don't run at the max. speed for a new machine, the 90% of the max. speed is acceptable.
- 4.Before install the machine on the table, please first uninstall the two support rods

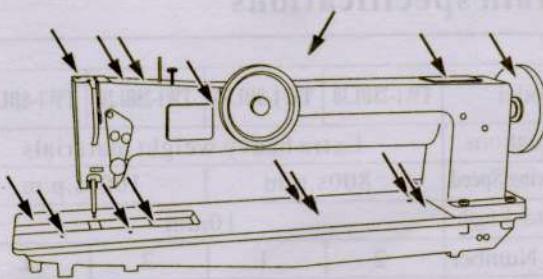

4.Needle(Fig.2)

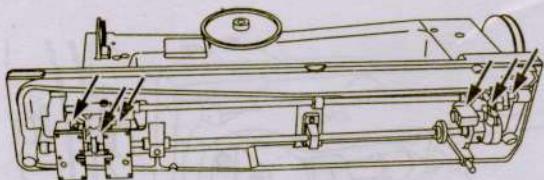

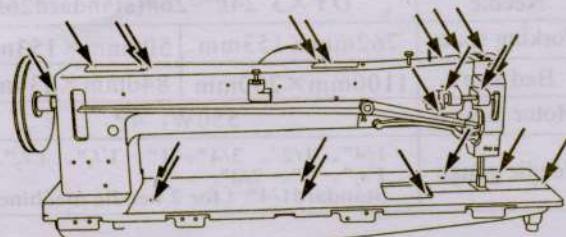

- 1.The standard needle type is DY×3(24#~26#) The right need should be choosed according to the thread and materials to be sewn
- 2.Install the needle: turn the hand wheel to lift the needle bar to its highest position,loosen the needle set screw, fully insert the needle shank up to the bottom of needle bar (single needle) or needle clamp(double needle),for single needle machine, keep the long groove leftward; for double needle machine, keep the long grooves of the two needles opposite with each other, then tighten the needle set screw.

3

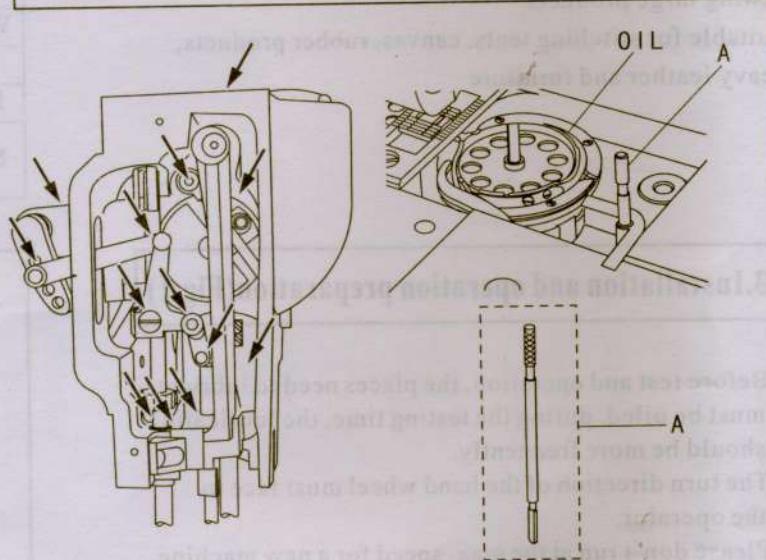

3

5.Lubrication(Fig.3)

- 1.Add 1-2 drops of oil in the places indicated by the arrows.
- 2.Put the oil indicator A out from the hook saddle, and fill oil in it until to the upper reference line.
- 3.Please lubricate at least twice every day if sewing continuously.

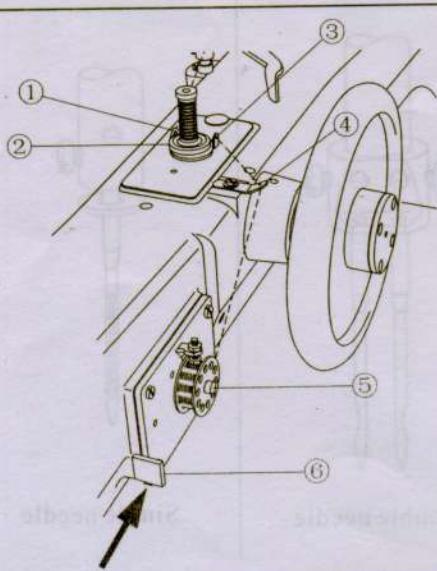

4

6.Thread(Fig.4)

Usually, the needle thread should be left twisted, but for double needle machine, the left needle thread should be right twisted.

5

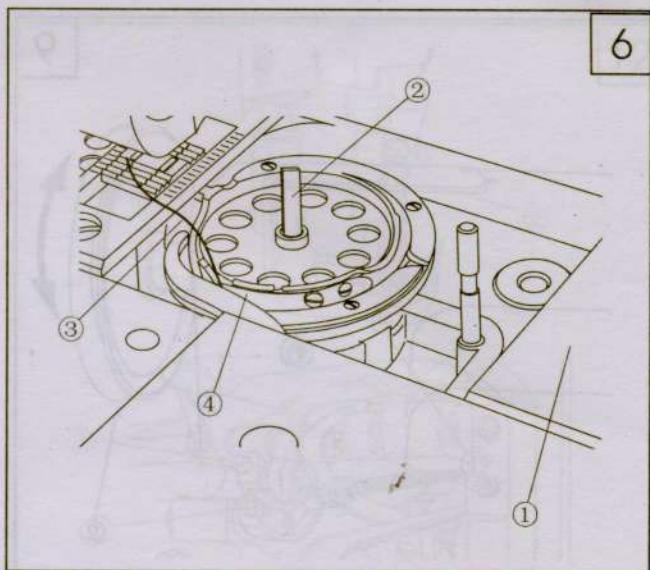

7.Winding the bobbin thread(Fig.5)

- 1.Drawing the bobbin thread through ①②③④, Wind thread several circles around bobbin and insert the bobbin into the shaft of bobbin winder ⑤.
- 2.put the winder lever ⑥ onto bobbin shown by arrow, then it can be automatic wound when sewing.

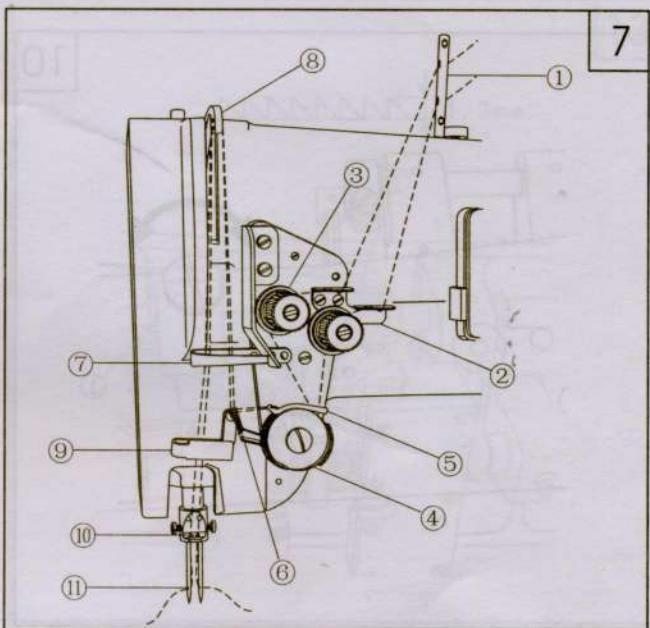

8.Installing the bobbin(Fig.6)

- 1.Open the slide plate ① and hook latch ②, then put the bobbin in the hook
- 2.Draw the bobbin thread ③ through hook lace ④ about 4-5cm, then lock the hook latch.
- 3.Close the slide plate.

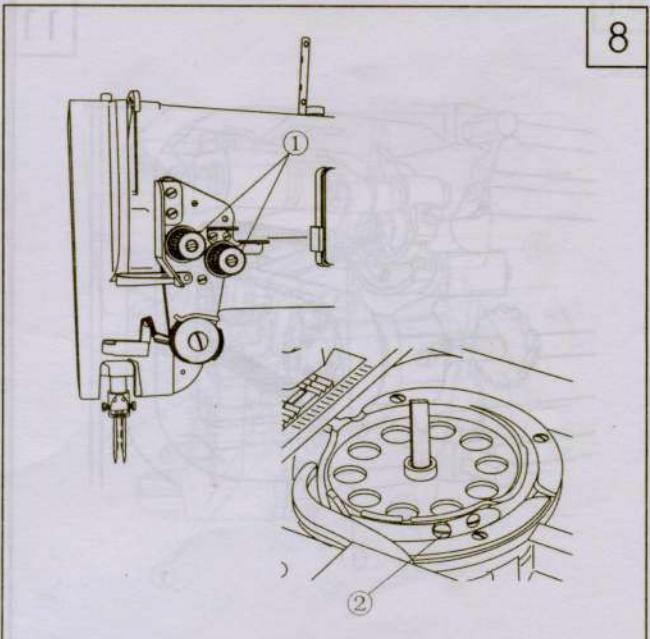

9.Threading the needle thread(Fig.7)

- 1.Passing the needle thred through thread guide pin ①,thread guide ②,thread tension ③, thread tension ④, lower thread guide rod ⑤,thread controller spring, upper thread guide ⑦,thread take-up lever ⑧,upper thread guide ⑨, lower thread guide ⑩, needle bar ⑪, and needle ⑫.
- 2.Hold the tip of needle thread by hand; turn the hand wheel to lower the needle bar, then lift it to its highest position, pull the needle thread and the bobbin thread will be drawn up accordingly, inally put the tip of needle thread and bobbin thread toward front under the presser foot.

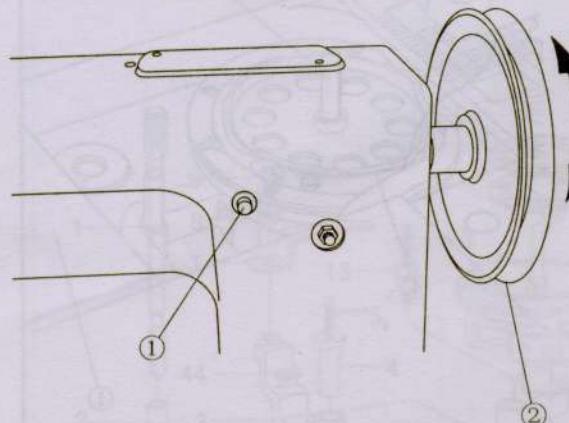

10.Adjusting the tension of needle thread and bobbin thread(Fig.8)

- 1.The tension of needle thread is controlled by the thread tension nut ①.
- 2.The tension of bobbin thread is adjusted by the Screw. Turn the screw clockwise to increase the tension and turn the screw counter-clockwise to decrease the tension

9

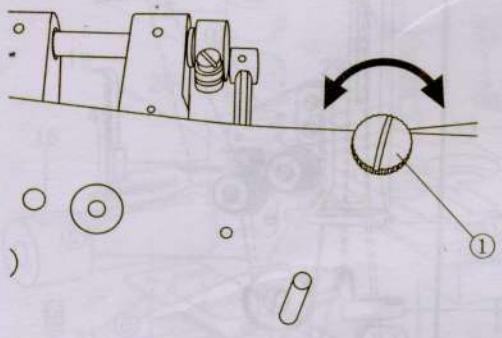

11. Adjusting the stitch length (Fig.9)

Put the stitch length button ① on the feed eccentric cam, press the button and turn the hand wheel ② slowly to adjust the stitch length.

Turn the hand wheel face to the operator to increase the length, on the contrary, to decrease the length.

When the required stitch length is obtained, release the button, and then begin to operate the machine.

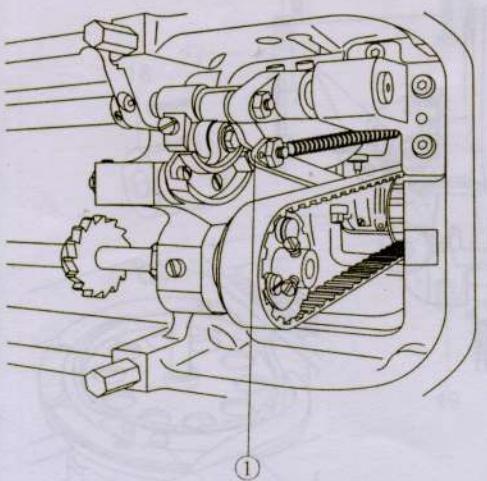

10

12. Adjusting the presser foot pressure (Fig.10)

Please turn the pressure regulating screw ① clockwise to increase the presser foot pressure, on the contrary, to decrease the pressure.

11

13. Reverse stitching (Fig.11)

Connect the reverse pedal with the block ①, when step on the pedal, the reverse stitching will be run.

14. Adjusting the feeding(Fig.12)

1. Adjust the feed eccentric cam to make the stitch length zero, at this position, the distance between vibrating presser bar ① and presser bar ② is 15.5mm(single needle) or 14.5mm(double needle). To adjust the stitch length by crank screw ③.

2. Usually, the position between feed dog and needle is: the needle should drop in the center of needle hole of feed dog. To adjust the position by screw ④.

3. After adjustment, please tighten the screws.

4. To adjust the eccentric cam ⑤ to control the max. stitch length.

15. Adjusting the feed dog(Fig.13)

The maximum height of feed dog over the surface of needle plate is 1.3mm, To adjust the height by screw ①.

16. Adjusting the timing between needle and hook(Fig.14)

Set the feed eccentric with the button at no feeding position, and confirm the distance between vibrating presser bar and presser bar should be 15.5mm.

1. If the needle bar and hook are correctly timed, the point of the hook will be at the center of the needle when the needle raised 3.8 ± 0.5 mm from the lowest point.

For the adjustment of timing, loosen the two screws ① for the hook driving gear, and tap this gear to the right or left in clearance of 2mm on the hook driving shaft until the point of the hook is at the center of the needle.

Tapping to the right gives on earlier hook timing, and to the left gives later hook timing.

Except the above case, to adjust in changing gear condition between hook driving gear ② and hook shaft gear ③.

Securely tighten the two screws for hook driving gear after finishing adjustment.

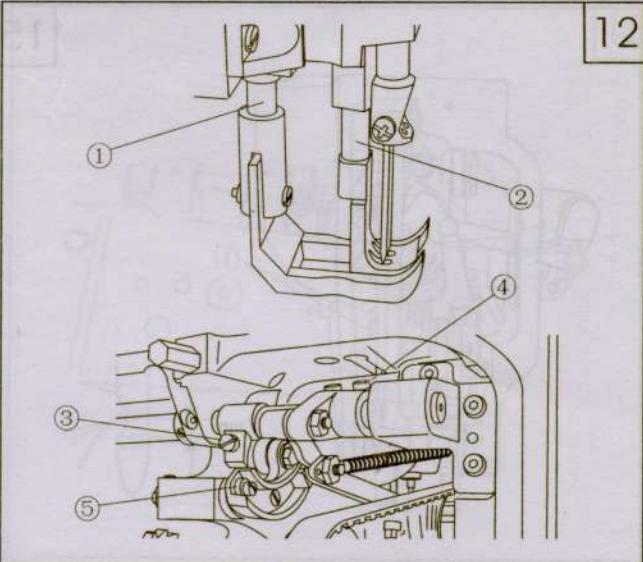

2. Normally, the clearance between hook point and scarf of needle is 0.02~0.1mm

a. Loosen screw ④⑤;

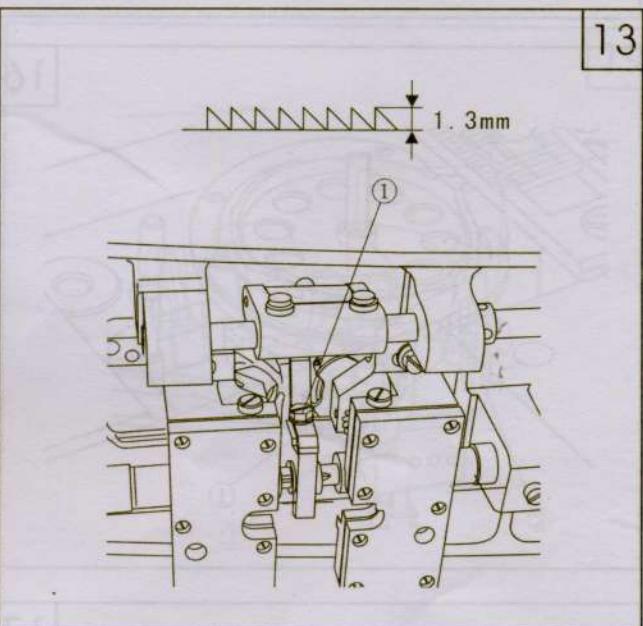

b. Move the hook saddle right or left until the hook point is as close to needle as possible, but without striking it;

c. Tighten the two screws;

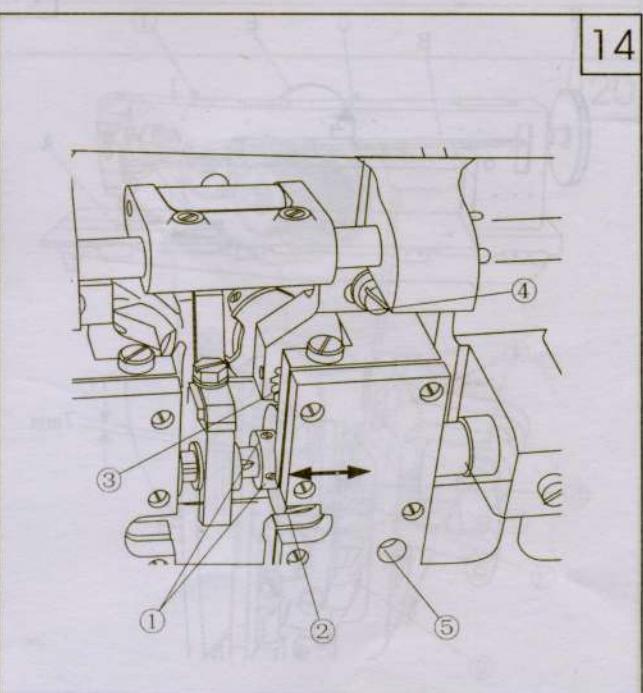

d. Before adjustment, please be sure that the needle doesn't bend.

12

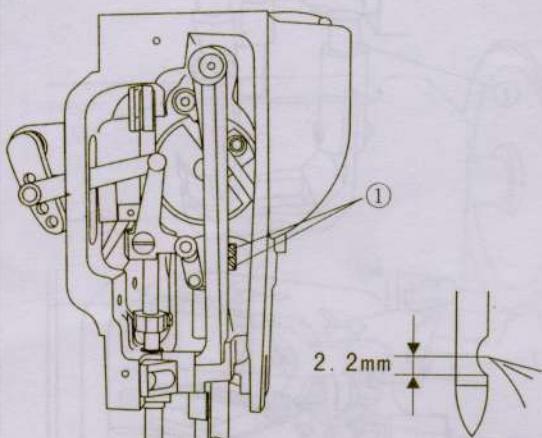

13

14

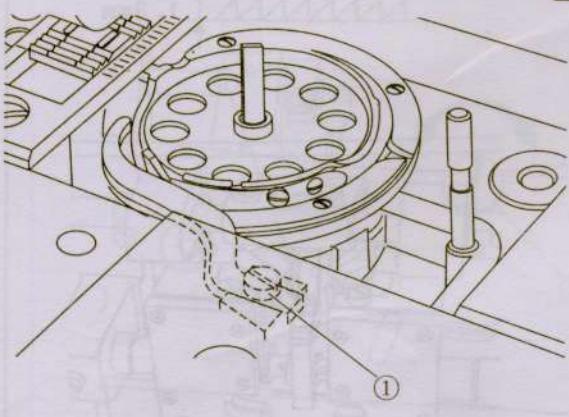

15

17. Adjusting the height of needle bar(Fig.15)

Normally, the clearance between top of the eye of needle and hook point is 2.2mm. In case the needle bar is incorrectly set, loose the needle bar set screw ① and place the needle bar in correct position as required, and then tighten the screw ①.

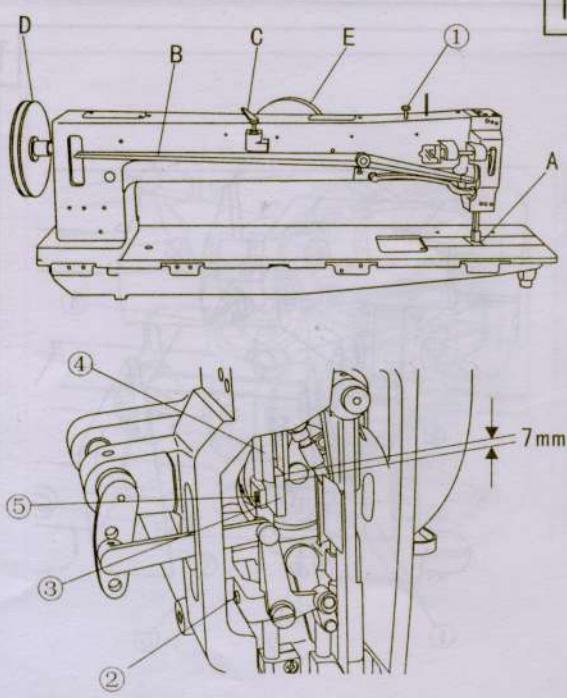

16

18. Adjusting the bobbin case opener(Fig.16)

1. Turn the hand wheel until the top of the opener ② is located at the distance from the needle plate;
2. In this position, adjust it so that the clearance between the inside edge of the opener and the top of the hook is about 0.3~0.8mm;
3. After adjustment, tighten the screw ①.

17

19. Adjusting the height of presser foot(Fig.17)

The distance between the surface of the needle plate (A) and the presser foot at stopped position is 19mm. When step on the lifting pedal, the stop lever(C) will be released by the lifting lever(B).

1. To change the relative lift of the presser feet, loosen the screw ① at the above condition.
2. The height of lift of the presser feet is adjustable by moving the screw of presser bar lifting bracket.
3. Normally, the distance between presser bar position guide bracket ③ and presser bar position guide ④ is 7mm.

Position of the vibrating presser foot to shift in left and right is to be adjusted by the screw ② for presser bar lifting bracket and the screw for presser bar position guide bracket.

20.Adjusting the timing of vibrating presser foot(Fig.18)

18

The amount of lift of the presser feet should be regulated according to the thickness of materials to be sewn.

The feet should lift just enough to clear the materials.

As a rule, the walking foot and presser foot should lift at the same height, but some grades of work may require that they lift an unequal height.

To change the relative lift of the presser feet, loosen the screw (A) for lifting rock shaft crank and move the vibrating presser bar upward or downward as required, then tighten the screw (A).

21.Adjusting the presser foot movement amount(Fig.19)

19

The lifting amount of presser foot and walking foot can be adjusted by the lifting bell crank link screw stud ①. To decrease the movement in setting the stud ① at the upper position, and to increase the movement in setting the stud ① at the lower position, after setting, tighten the stud ① with nut ②.

The clearance for the presser foot and walking foot are being adjusted at maximum, so that the clearance of them should be adjusted according to the materials to be sewn.

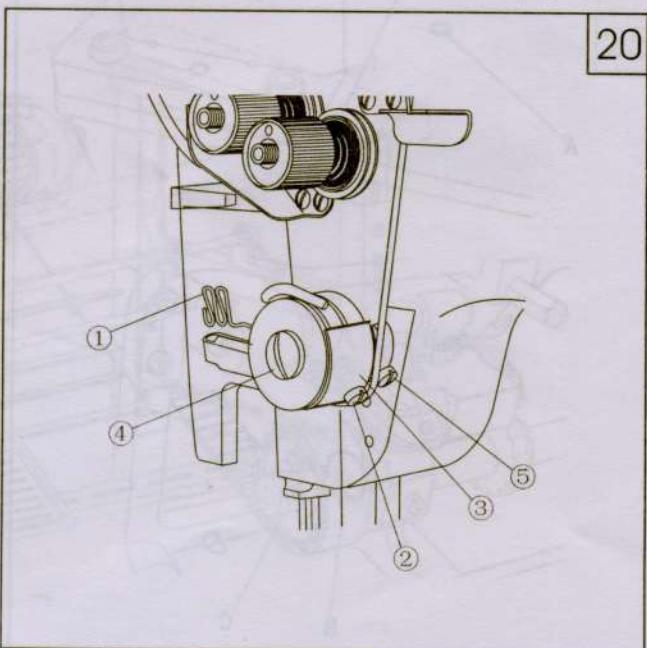

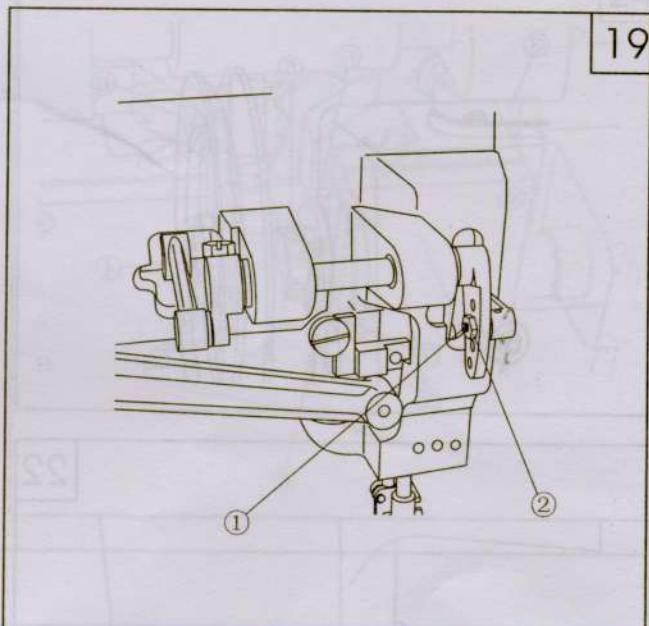

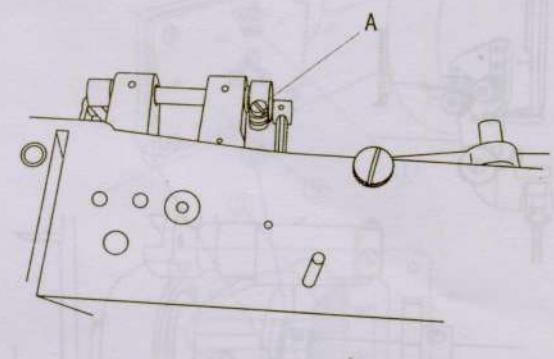

The timing position for the presser feet should be regulated by Fig.18.

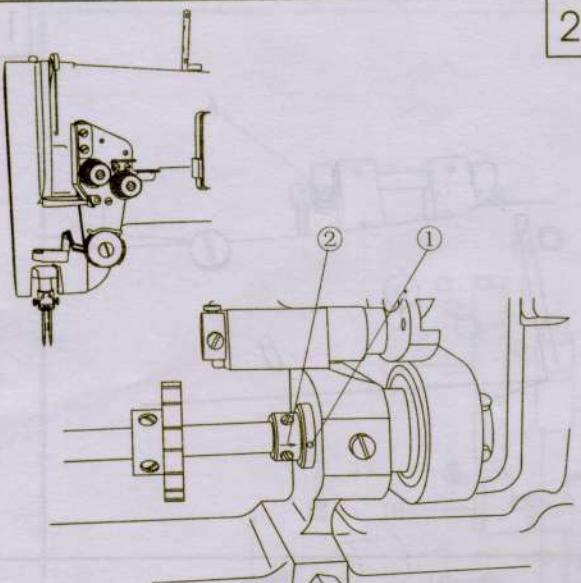

22.Adjusting the thread controller spring(Fig.20)

20

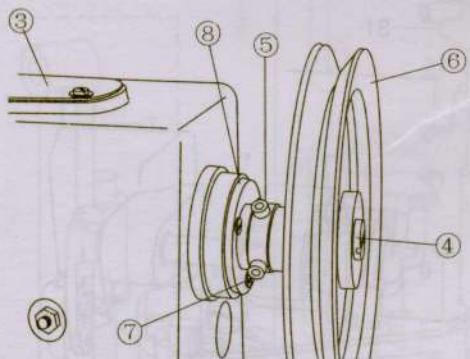

1. For more or less controller spring ① action on the thread, loosen the screw ② and turn the stop plate ③ to increase or decrease the action.

2. Adjusting the tension of controller spring:
loosen the nut ④ and screw ⑤, turn the spring stud screw leftward with a screwdriver to increase the tension, or turn the stud screw rightward to decrease the tension, finally, tighten the screw ⑤.

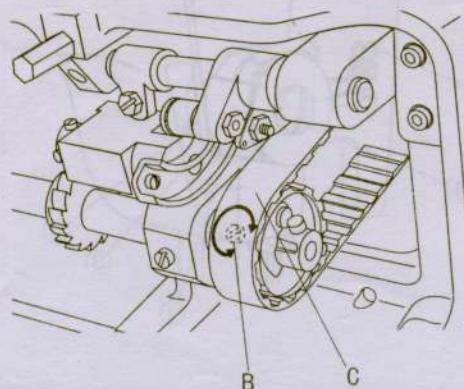

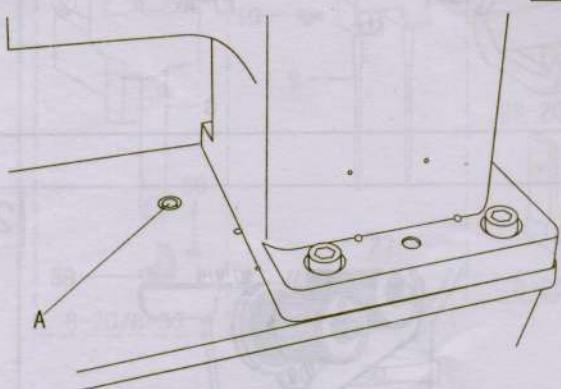

21

22

23. Replacing the timing belt(Fig.21)

A. When the timing belt removed from the pulley for adjustment and/or replacing spare parts, it should be replaced by the following processes:

- 1.Turn the hand wheel to lift the thread take-up lever to its highest position;
- 2.Turn the hook shaft with the fingers until the arrow mark on the hook driving shaft bush collar ② and the red point mark on the hook driving shat bush ① are directly in line, then replace the belt over the upper and lower pulley.
- B. Replacement of the timing belt when damaged
- 1.Remove the upper arm plate and oil reservoir ③
- 2.Looseen the hand wheel set screw ④ and other Two screw ⑤,then remove the hand wheel ⑥;
- 3.Looseen the three screws ⑦ in the upper shaft bush and remove the bush ⑧;
- 4.Lift the belt up through the arm cap hole after removed the bush as far as possible and draw it out through the space normally occupied by the bush.
- 5.Replace the timing belt as opposite processes as above for removing it
- 6.Tighten all of the screws, so as to fit the upper shaft, free from looseness.

24. Safety clutch mechanism(Fig.22)

The safety clutch located on the right side of the lower timing pulley, it can prevent damage in the event of thread jamming in the hook by releasing the locking lever in the pulley.

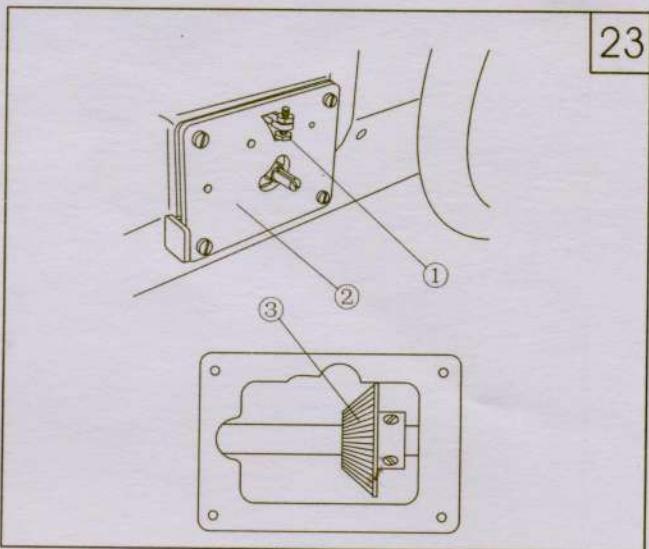

- 1.Take out jammed thread from the hook;
- 2.To re-engage the clutch, press down the lock stud(A)by left hand, and turn the hand wheel backward slowly by right hand, then the safety clutch will be released.
- 3.In case easily releasing the safety clutch, adjust the pressure by the screw(B)after removed the timing belt(C).Turn the screw (B)clockwise to increase the pressure, and turn the screw (B) counter-clockwise to decrease the pressure

25.Adjusting the bobbin thread winder(Fig.23)

23

Adjust the volume of winding thread to the bobbin by the adjustment screw ①

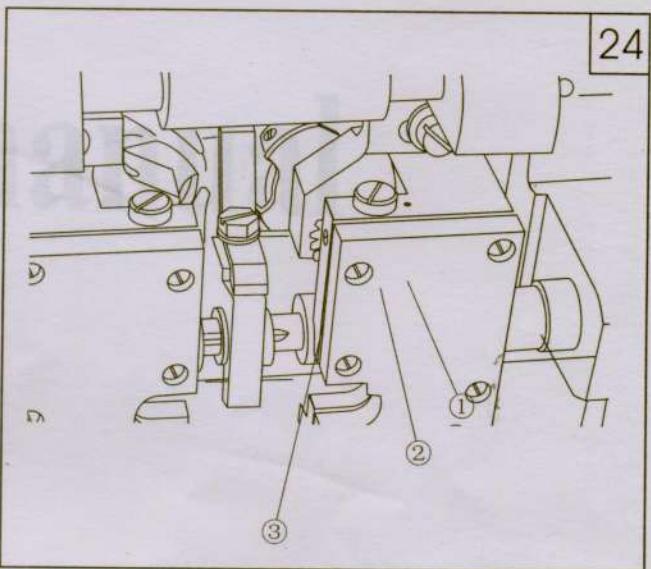

Remove the plate ② on the front of the arm and adjust the slippage of the shaft for the winder by the winder driving gear ③ in the upper shaft to shifting right or left.

26.Adjusting the hook oil amount(Fig.24)

24

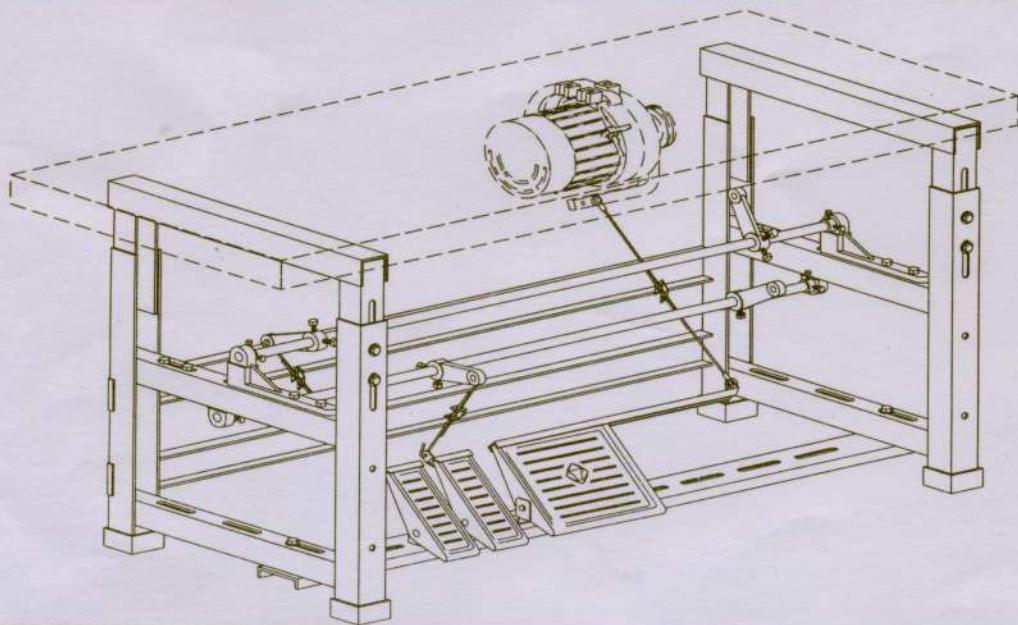

Loosen the screw ③ for the oil adjustment dial ② and adjust oil supply by truning the oil adjustment dial. When the point mark ① on the hook saddle is in line with the center line o the dial ②, the oil supply will be at the maximum level, when the point mark is at the vertical position of the center line of the dial, the oil supply will stop.

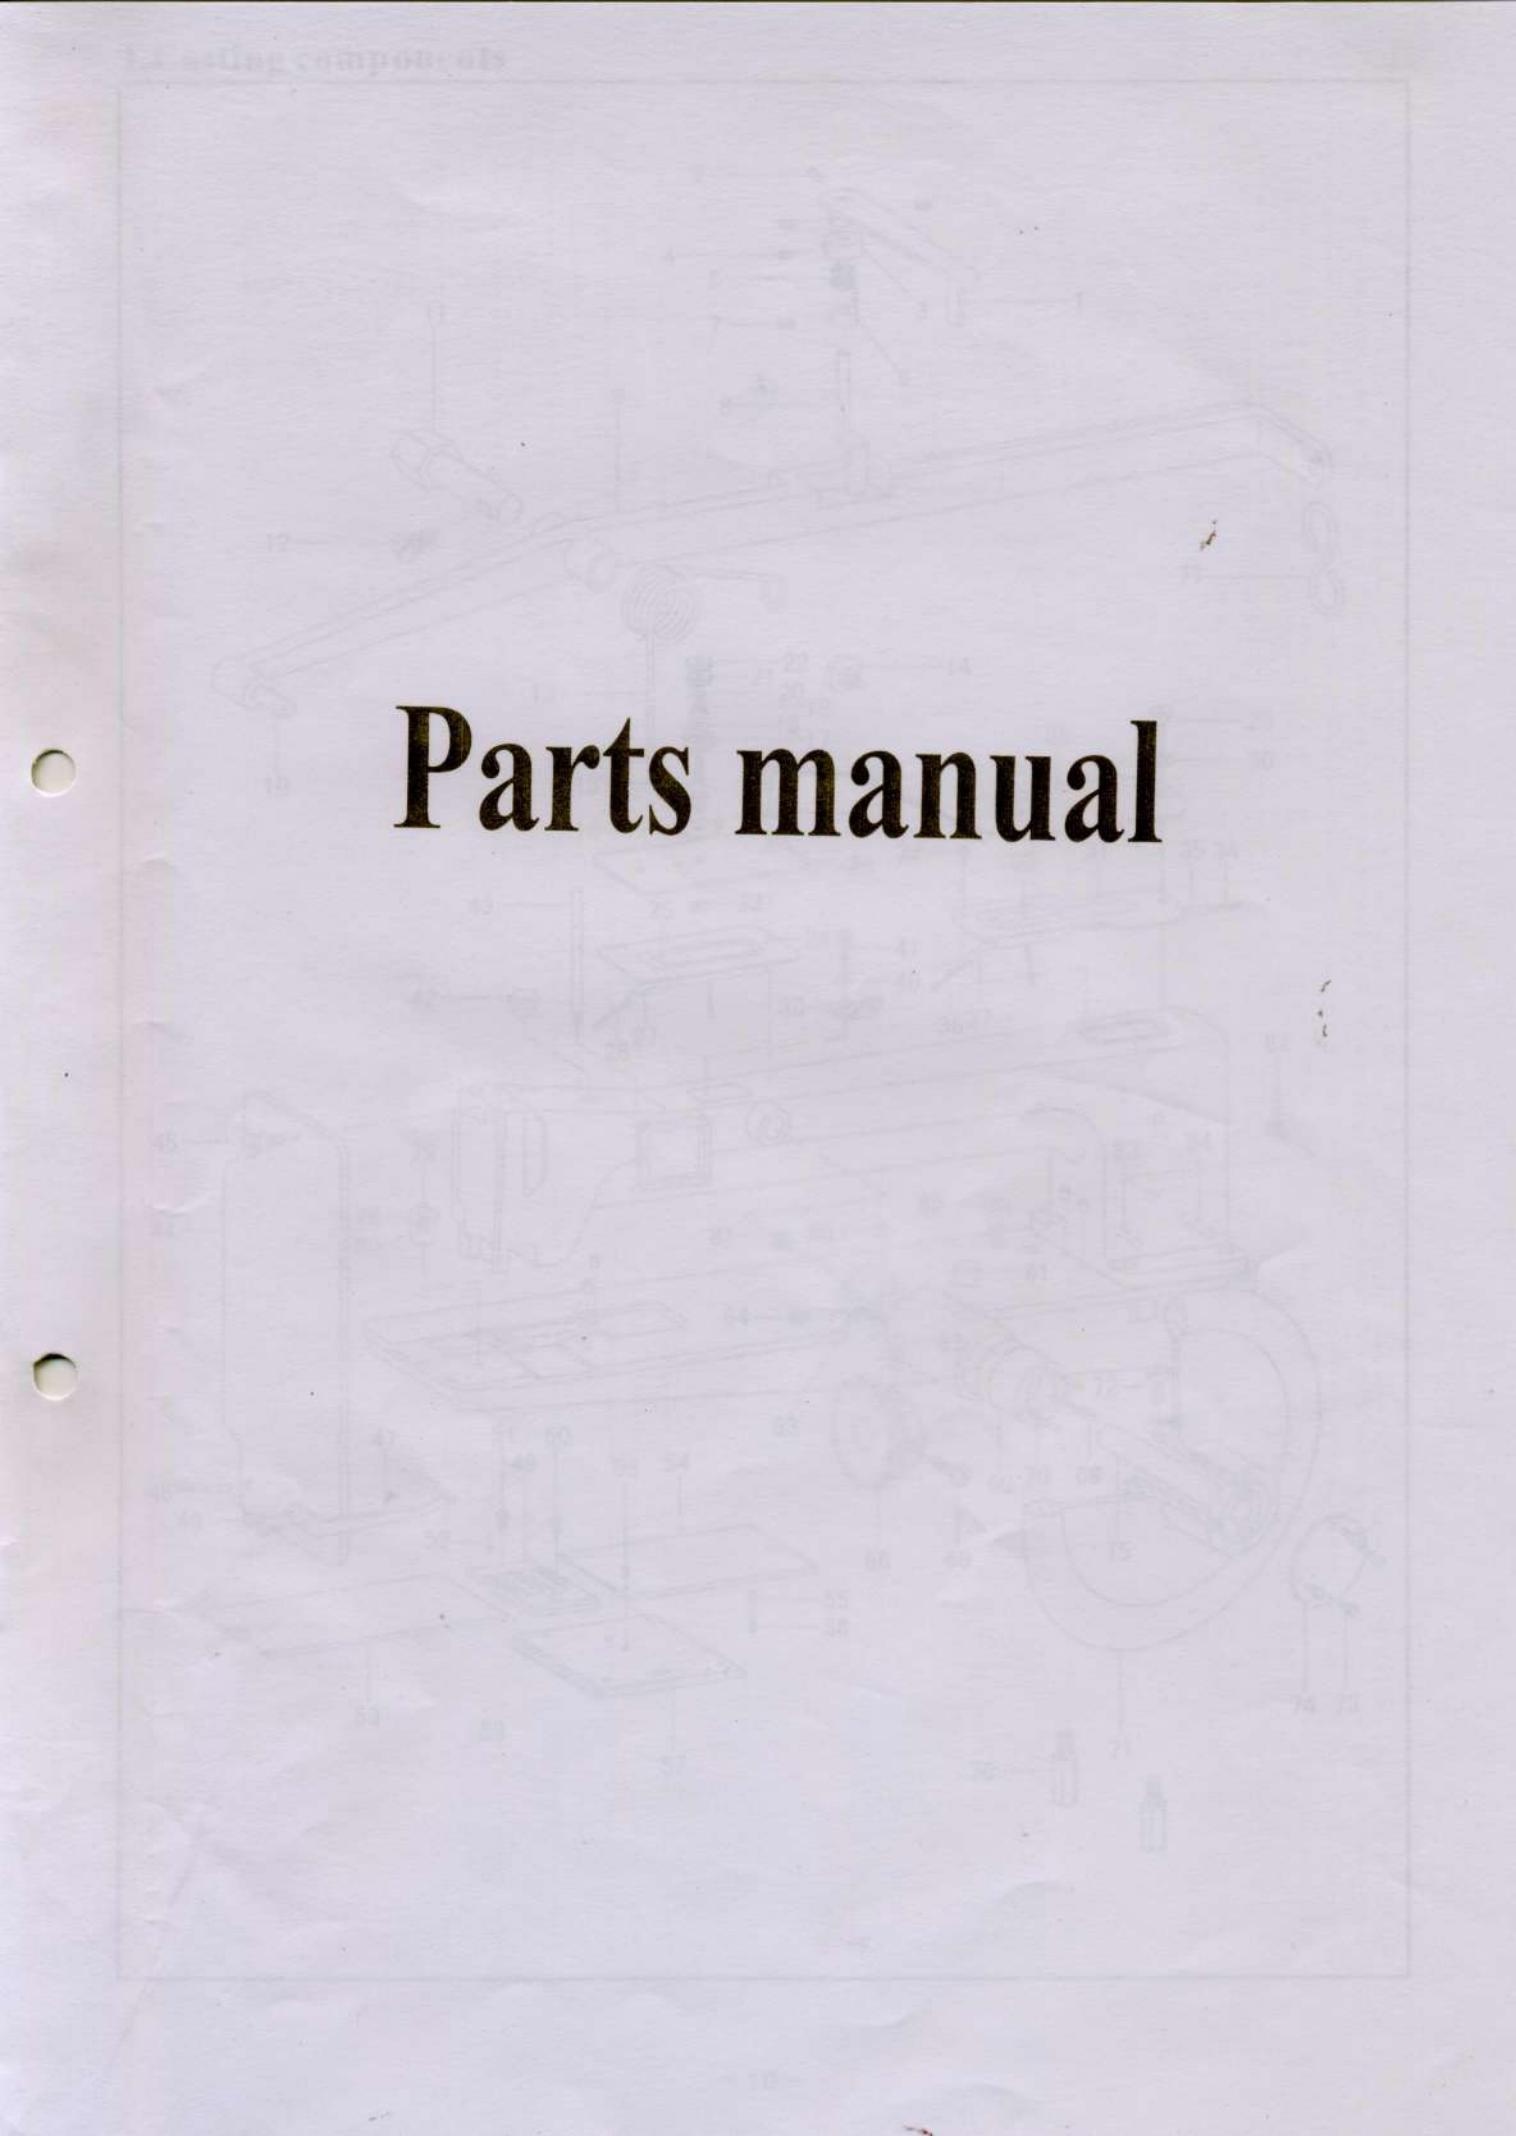

27.Adjusting the pedal(fig.25)

25

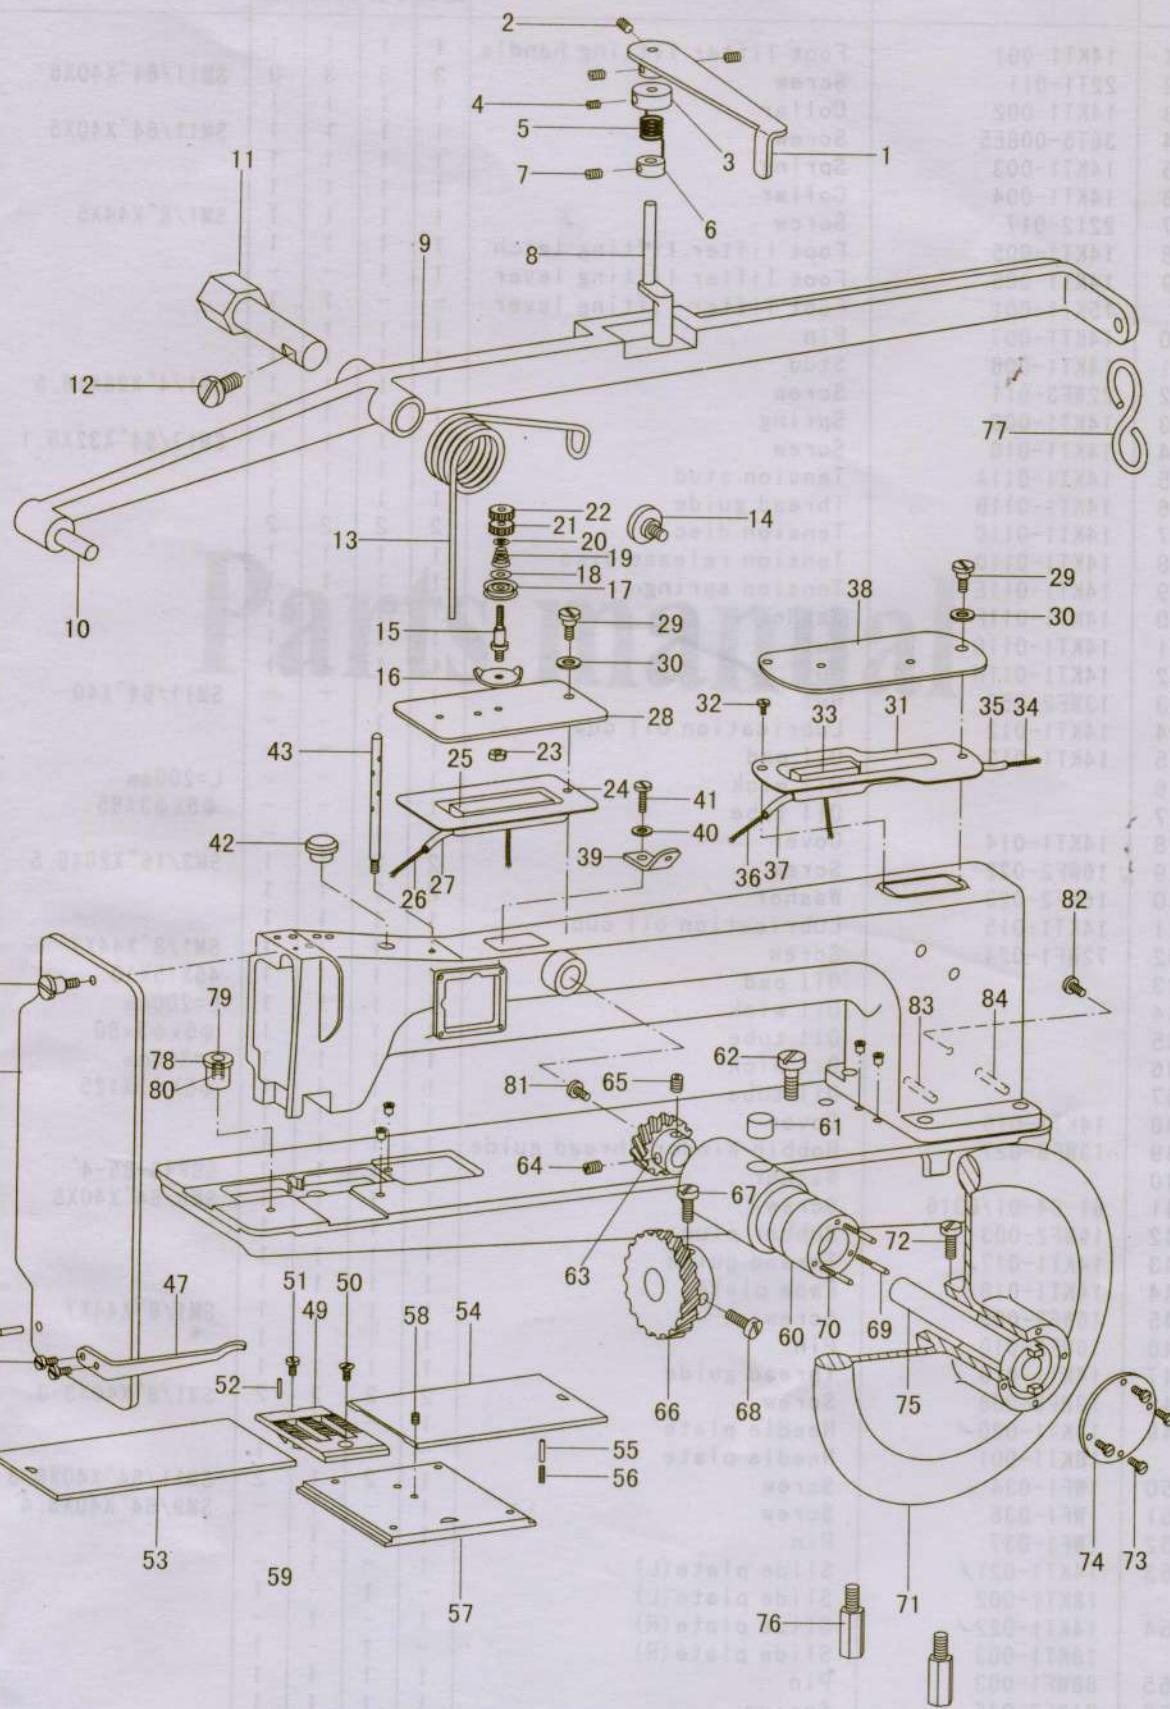

Construct the pedal set complete as shown in the Fig.25
